

Executive Summary

Three key findings from 18 months of sales data

1

+6.5%

Comp sales growth
39 comparable stores

10

Stores below target
25% of the chain

+10.2pp

A/B test real lift
 $p = 0.014$

31 of 31

Vendors below GMROI 1.0
median 0.61

- **1. The business is growing, but not everywhere.**

Comparable sales grew +6.5% year over year. But 8 of 39 stores went down. EXPRESS grew fastest (+11.6%).

- **2. The new display test works - but the first reading was wrong.**

A simple comparison says the test lost 17%. The groups were not balanced before the test. After correction, the test won.

- **3. We cannot measure stock-outs today. We have sales data, but no inventory data.**

Any stock-out number we report now would not be reliable. This is a data gap, not an operations result.

Store Performance

Comparable sales: Jan-Jun 2025 vs Jan-Jun 2024

2

Growth by store format

Growth by country

Best and worst

Best store: TIENDA_036 (EXPRESS, Costa Rica) +23.4%

Worst store: TIENDA_025 (DESCUENTO, Nicaragua) -7.5%

8 of 39 comparable stores had negative growth. Guatemala is the slowest market at +4.9%.

Opportunities

Where we can gain sales without opening new stores

3

1. Low productivity stores

10 stores are below the 25th percentile of sales per square meter, inside their own format.
If these 10 stores reach only the 25th percentile, we gain about \$688,000 per year.

Guatemala has 4 of the 10 low performing stores.

2. Vendor margin

All 31 vendors have GMROI below 1.0. The median is 0.61. This means every vendor returns less margin than the cost we invest. This is a chain wide pricing or cost problem, not a vendor problem.

Action: renegotiate the bottom 8 vendors (GMROI below 0.55) first.

3. Loyalty program

Only 40.2% of transactions are identified. Month 1 retention is 63% to 78%.

Important: loyalty customers do NOT spend more (\$280 vs \$278, not significant).

Customer concentration

Our top 10% of customers bring only 16% of sales.

In most retail, the top 10% brings 30% to 40%.

What this means:
we have no strong VIP group.

So loyalty campaigns must be broad, not targeted to a few big spenders.

Categories are concentrated, customers are not:
3 of 8 categories = 84% of sales (Electronics, Home, Clothing).

Risks

4

Data quality problems that affect our decisions

Control stores were 71% larger (3,100 m2 vs 1,813 m2) before the test started.

A simple comparison shows -17%. The corrected result shows +10.2pp. Opposite conclusion.

We cannot measure stock-out losses

We have sales data, but we do not have inventory data.

Using 'no sale for 3+ days' as stock-out gives a loss 7x larger than our real sales.

The number is not usable. We must not report it to the board.

Small data quality issues to fix

1,745 transactions (1.0%) do not match the sum of their own line items.

50 transactions in TIENDA_037 happened before the store opening date.

TIENDA_012 had 8 days with zero sales. We do not know if it closed or stopped reporting.

Main risk

If we trust the first A/B test reading, we cancel a display that actually works. Design of experiments needs a review.

Recommendations

What to do, who does it, and by when

5

ACTION	OWNER	DEADLINE	IMPACT
Roll out the new display to all 40 stores, after one clean re-test of 6 weeks.	Merchandising	Q4 2026	+10.2pp GMV
Launch a recovery plan for the 10 stores below the 25th percentile.	Regional Ops	90 days	+\$688K / year
Renegotiate cost with the 8 vendors with GMROI below 0.55.	Commercial	Q4 2026	31 vendors < 1.0
Add inventory data to the pipeline so we can measure real stock-outs.	Data Engineering	6 months	Unblocks KPI
Fix the experiment assignment process. No store in two groups again.	Data + Merch.	30 days	2 stores lost
Grow loyalty sign-up from 40.2% to 50%.	Marketing / CRM	12 months	+10pp coverage
North Star Metric for the productivity program			
Comparable GMV per square meter, measured inside each format.			
It grows only if traffic or ticket improves. It cannot grow just by opening new stores.
